## DAWN Info

**<Integrated GPU> Vulkan backend - Intel(R) Graphics (ADL GT2)**  
**[Default Toggle Names]**

- **lazy\_clear\_resource\_on\_first\_use**: <https://crbug.com/dawn/145>: Clears resource to zero on first usage. This initializes the resource so that no dirty bits from recycled memory is present in the new resource.
- **use\_temporary\_buffer\_in\_texture\_to\_texture\_copy**: <https://crbug.com/dawn/42>: Split texture-to-texture copy into two copies: copy from source texture into a temporary buffer, and copy from the temporary buffer into the destination texture when copying between compressed textures that don't have block-aligned sizes. This workaround is enabled by default on all Vulkan drivers to solve an issue in the Vulkan SPEC about the texture-to-texture copies with compressed formats. See #1005 (<https://github.com/KhronosGroup/Vulkan-Docs/issues/1005>) for more details.
- **vulkan\_use\_d32s8**: <https://crbug.com/dawn/286>: Vulkan mandates support of either D32\_FLOAT\_S8 or D24\_UNORM\_S8. When available the backend will use D32S8 (toggle to on) but setting the toggle to off will make it use the D24S8 format when possible.
- **vulkan\_use\_s8**: <https://crbug.com/dawn/666>: Vulkan has a pure stencil8 format but it is not universally available. When this toggle is on, the backend will use S8 for the stencil8 format, otherwise it will fallback to D32S8 or D24S8.
- **disallow\_unsafe\_apis**: <http://crbug.com/1138528>: Produces validation errors on API entry points or parameter combinations that aren't considered secure yet.
- **use\_vulkan\_zero\_initialize\_workgroup\_memory\_extension**: <https://crbug.com/dawn/1302>: Initialize workgroup memory with OpConstantNull on Vulkan when the Vulkan extension VK\_KHR\_zero\_initialize\_workgroup\_memory is supported.  
**[WebGPU Forced Toggles - enabled]**

- **disallow\_spirv:** <https://crbug.com/1214923>: Disallow usage of SPIR-V completely so that only WGSL is used for shader modules. This is useful to prevent a Chromium renderer process from successfully sending SPIR-V code to be compiled in the GPU process.

See #1005 (<https://github.com/KhronosGroup/Vulkan-Docs/issues/1005>) for more details.
- **vulkan\_use\_d32s8:** <https://crbug.com/dawn/286>: Vulkan mandates support of either D32\_FLOAT\_S8 or D24\_UNORM\_S8. When available the backend will use D32S8 (toggle to on) but setting the toggle to off will make it use the D24S8 format when possible.
- **vulkan\_use\_s8:** <https://crbug.com/dawn/666>: Vulkan has a pure stencil8 format but it is not universally available. When this toggle is on, the backend will use S8 for the stencil8 format, otherwise it will fallback to D32S8 or D24S8.
- **disallow\_unsafe\_apis:** <http://crbug.com/1138528>: Produces validation errors on API entry points or parameter combinations that aren't considered secure yet.
- **use\_vulkan\_zero\_initialize\_workgroup\_memory\_extension:** <https://crbug.com/dawn/1302>: Initialize workgroup memory with OpConstantNull on Vulkan when the Vulkan extension VK\_KHR\_zero\_initialize\_workgroup\_memory is supported.

**[WebGPU Forced Toggles - enabled]**

- **disallow\_spirv:** <https://crbug.com/1214923>: Disallow usage of SPIR-V completely so that only WGSL is used for shader modules. This is useful to prevent a Chromium renderer process from successfully sending SPIR-V code to be compiled in the GPU process.

**[Supported Features]**

- pipeline-statistics-query
- timestamp-query
- timestamp-query-inside-passes
- depth-clip-control
- depth32float-stencil8

### <CPU> Vulkan backend - SwiftShader Device (Subzero)

**[Default Toggle Names]**

- **lazy\_clear\_resource\_on\_first\_use:** <https://crbug.com/dawn/145>: Clears resource to zero on first usage. This initializes the resource so that no dirty bits from recycled memory is present in the new resource.
- **use\_temporary\_buffer\_in\_texture\_to\_texture\_copy:** <https://crbug.com/dawn/42>: Split texture-to-texture copy into two copies: copy from source texture into a temporary buffer, and copy from the temporary buffer into the destination texture when copying between compressed textures that don't have block-aligned sizes. This workaround is enabled by default on all Vulkan drivers to solve an issue in the Vulkan SPEC about the texture-to-texture copies with compressed formats. See #1005 (<https://github.com/KhronosGroup/Vulkan-Docs/issues/1005>) for more details.
